

Established in 2007, the NECS building group is the largest certified Guardian warm roof fabricator in the UK

Equipped with ultramodern technology, NECS fabricates and builds each Guardian warm roof in the workshop before they are flat-packed and delivered to site. As a result of this meticulous detail, installers can efficiently fit the Guardian warm roof in half the time of other conservatory replacement systems according to a spokesman.

The company claims that its warm roof system is a fast-install conservatory roof replacement system that has very few structural components. “The prefabricated aluminium frame is lighter and stronger than wood frame systems and does not require specialist tooling for installation’s, says a Guardian spokesman.

Through years of development, the Guardian has designed its warm roof to have minimal installation steps which, it claims, reduces error margins and improves quality. The system is tested by the BRE and is building regulation compliant for both new builds and refurbishments.

Throughout the fabrication process, NECS utilises software and fabrication tools provided by Guardian Building Systems. This enables pre-cutting and structure

mapping of the roof This technology helps ensure that the material sent to site is unpacked in the correct order for installation. For instance, Guardian slates are uniquely pre-cut and coded for each roof, and then are packed in order. Ray Button, NECS production manager, says: “When building the Guardian warm roof in the workshop, we pre-cut the insulation panels, so that our installers don’t need to measure and cut each piece before installation. This

saves time on site and reduces material waste. Overall, when it comes to installing a standard Guardian warm roofs with these methods you can expect to save a least an hour on site.

“The NECS network creates unmatched opportunities for fenestration installers in the North-East and other areas in the UK. When you join as a certified Guardian warm roof installer, you will receive full system and sales training and building control approval for each project. Also, thanks to the smart fabrication processes at NECS, you can install a typical Guardian warm roof in as little as two days. Meaning your customers can get back to enjoying their conservatory sooner and you can plan more jobs in advance.” □
